

$$\Upsilon(\beta) := (2\pi)^{-d} \int_{\mathbb{R}^d} \frac{\widehat{f}(\mathrm{d}\xi)}{\beta + |\xi|^2} < \infty$$

Dalang's condition (1.12):
 Existence of mild solution [6, 2];
 Weak sample path comparison [3];
 Stochastic comparison [18, 19];

$$\Upsilon(0) < \infty$$

Phase transition condition (1.10a),
 Moment pointwise boundedness [2]

+

$$\Upsilon_\alpha(\beta) := \int_{\mathbb{R}^d} \frac{(2\pi)^{-d} \widehat{f}(\mathrm{d}\xi)}{(\beta + |\xi|^2)^{1-\alpha}} < \infty$$

Strengthened Dalang's cond. (1.13):
 Hölder continuity [20, 3];
 Strong path comparison [3];
 Factorization Lemma 3.3.

$$\int_{\mathbb{R}^d} \frac{\widehat{f}(\mathrm{d}\xi)}{|\xi|^2 \wedge |\xi|^{2(1-\alpha)}} < \infty$$

Invariant measure condition (1.19).
