

Here are comments for ef9867aa on the file – *thesis.tex*:

1. Beginning of Section 4,
 - (a) equation 1.1 should be equation (1.1);
 - (b) W is a 0-mean $\rightarrow \dot{W}$ is a centered;
 - (c) indexed on $\rightarrow$ indexed by;
2. Last centered equation on p. 11, the second $\mathbb{R}^{2d}$ should be $\mathbb{R}^d$.
3. Part 1 of Assumption 4.1, absolute continuity of Γ doesn't imply that of μ . Think about the case when $\Gamma = \text{Leb}$. If you do want the second part, you need to assume that μ is also absolutely continuous w.r.t. Leb . Or probably you need to assume only one of these two?
4. Lemma 4.5:
 - (a) The statement, “for all $t > 0$ and $x, y \in \mathbb{R}^d$ ”.
 - (b) You forgot period for Eq. (4.6); check all such typos.
 - (c) Remove the extra period in the second last centered equation in the proof.
 - (d) The last centered equation, should $\leq$ be $=$?
5. Theorem 4.6:
 - (a) $\dot{F}$ should be $\dot{W}$.
 - (b) First centered equation, add “for $n \geq 1$ ”.
 - (c) You forgot $\|\cdots\|_2$ in the 5th centered equation in the proof.
 - (d) One has to make proper assumptions on initial conditions. You didn't show how $J_0(t, x)$ plays a role in the iteration. If initial condition are bounded, one needs only check Dalang's condition and cite Dalang 99 paper for this standard result.
Response - I believe that we will need
6. Conjecture 4.9:

Response - I am going to remove this conjecture as if the proof is going to work, we will need to assume that $u_0 = 1$ and $v_0 = 0$.

 - (a) The assumption for being in $L^1(\mathbb{R}^d)$ seems too much, which exclude constant initial condition.
 - (b) After the first line of the first centered equation, did you try to apply the intermediate theorem on Z ?
